15. Write a Java program using the switch case to print the corresponding days of numbers.
For example: 1= Monday.... 7 = Sunday.

```java
import java.util.*;
public class day {
    Run | Debug
    public static void main(String[] args) {
        int button;
        Scanner y = new Scanner(System.in);
        System.out.println(x:"Enter the input: ");
        button = y.nextInt();
        switch (button) {
            case 1:
                System.out.println(x:"Monday");
                break;
            case 2:
                System.out.println(x:"Tuesday");
                break;
            case 3:
                System.out.println(x:"Wednestday");
                break;
            case 4:
                System.out.println(x:"Thursday");
                break;
            case 5:
                System.out.println(x:"Friday");
                break;
            case 6:
                System.out.println(x:"saturday");
                break;
            default:
                System.out.println(x:"Sunday");
                break;
        }
    }
}
```

Output:

```
Enter the input:
4
Thursday
```
